

COMP66060 Master Project Rubric

1 Project Assessment Criteria and Weighting

Report Components (85% of overall grade)	
Abstract	5%
Introductory Material	20%
Methodology	20%
Evaluation and/or Reflection	20%
Conclusion	10%
Format and Structure	5%
Project Achievement	20%
Video Components (15% of overall grade)	
Use of the Medium	40%
Complementing the Report	40%
Presentation	20%

Table 1: Breakdown of Report and Video Weightings

2 General Guidelines

2.1 Report

Reports are expected to be around **8,000 words** long. Submissions significantly outside the range of 7,000-9,000 will be penalised. References, appendices, and figure/diagram/table captions are not included in the word count.

In the new report format, there is no separate “Background” section. Instead, the “Introduction” should present the subject area clearly and include a concise literature review. The focus should be on depth rather than breadth, highlighting key works necessary to understand the problem and justify your approach. **An extensive literature review is thus not required.**

2.2 Video

The video should be **6–8 minutes** long, structured with a clear beginning, middle, and end.

The video should complement the report, adding additional insight that was not possible in text alone. This might be, for example, animations or demos of the software in action, interactive visualisations to highlight key trends, or real-time simulations that help the audience better understand complex concepts and workflows.

For the format, a simple voice-over on a PowerPoint-style presentation is acceptable, but more creative, polished productions will score higher in the “Use of Medium” category. A talking-head overlay (you speaking in the corner) is strongly encouraged.

3 Assessment Criteria

3.1 Report

Please note, the below criteria are **not** intended to be strict section heading requirements—the exception being that every project should have separate Abstract and Conclusion sections.

3.1.1 Abstract (5%)

This section is expected to clearly present a concise summary of the project’s purpose, methods, and key results.

- Does the abstract give an appropriate executive summary of the work?

3.1.2 Introductory Material (20%)

You should clearly describe the project setting, scoping the subject area with proper citations and figures, and stating the objectives.

- Does the work effectively establish the context (why this project matters), and clearly explain the subject area (what this project is about), with proper citations/figures?
- Are the project objectives clearly stated, coherent and appropriate?

3.1.3 Methodology (20%)

You should clearly explain (using figures, diagrams, and tables where appropriate) how the project goals are achieved by describing the methods used. You must include a justification and reasoning behind selecting these methods, demonstrating their suitability for the project, and consideration of alternative approaches.

- Is it clear what methods were used to achieve the project goals?
- Is there a well-reasoned justification for why these methods were chosen and compared/contrasted with alternative approaches?

3.1.4 Evaluation and/or Reflection (20%)

You should present the evaluation, testing, or critical reflection (using figures, diagrams, and tables, where appropriate). You should also provide a justification for the evaluation methods chosen and demonstrate alignment with the project goals.

- Has appropriate evaluation, testing, or critical reflection, relevant to the project's subject area been considered?
- Is there clear justification and alignment of the evaluation methods with the project goals?

3.1.5 Conclusion (10%)

This section should present clear, well-justified conclusions supported by the project's outcomes and aligned with its original objectives. It should also include thoughtful analysis of the project approach, offering well-reasoned suggestions for future work.

- Are the project conclusions clearly stated, drawing on appropriate evidence from the report body, and overall aligned with the objectives as proposed in the introduction?
- Is there a thoughtful analysis on the project process with well-justified suggestions for future work?

3.1.6 Format and Structure (5%)

This criterion evaluates the organisation and clarity of the report. Your report should have a logical structure with clearly defined sections, properly numbered figures, tables, and equations, and correctly formatted references. The writing should ideally be clear and well-expressed.

- Is the report well-structured and professionally presented?
- Are references complete, correctly formatted, and consistent with academic standards?

3.1.7 Project Achievement (20%)

This criterion assesses the overall achievement of the project as can be determined from the report. It evaluates two key aspects: 'the complexity, scope and challenges' and 'the execution quality', meaning how well the artefact is built, its reliability, and technical accuracy.

- How challenging/complex is the proposed artefact in terms of design and functionality, and how wide is the scope?
- How effectively is the artefact implemented, in terms of build quality, reliability, and technical accuracy?

3.2 Video

3.2.1 Use of the Medium (40%)

This criterion evaluates how effectively the video format communicates the project through visuals, audio, and editing, ensuring clarity and engagement. Creativity is encouraged if it enhances the message without excessive production effort.

- How well does the video use visuals and audio to clearly and professionally present the project?
- How much effort and professionalism are evident in the creation of the video?

3.2.2 Complementing the Report (40%)

This assesses whether the video presents aspects of the project that were completed during the project, but not fully covered in the written report, offering clarification that may be difficult to convey through text or figures alone.

- Does the video reveal additional aspects of the project not included in the report?
- How effectively do these additions demonstrate the completeness of the project and its alignment with the original goals?

3.2.3 Presentation (20%)

This criterion assesses how effectively the video communicates the project within the expected duration (6-8 minutes), balancing clarity and depth with conciseness. It also evaluates the structure, pacing, and alignment of spoken content with visuals to ensure a smooth and engaging presentation.

- Is the video clear, well-paced, and logically structured, staying within the required duration?
